The 15th IEEE International Conference on Green Computing and Communications  
(GreenCom-2019)

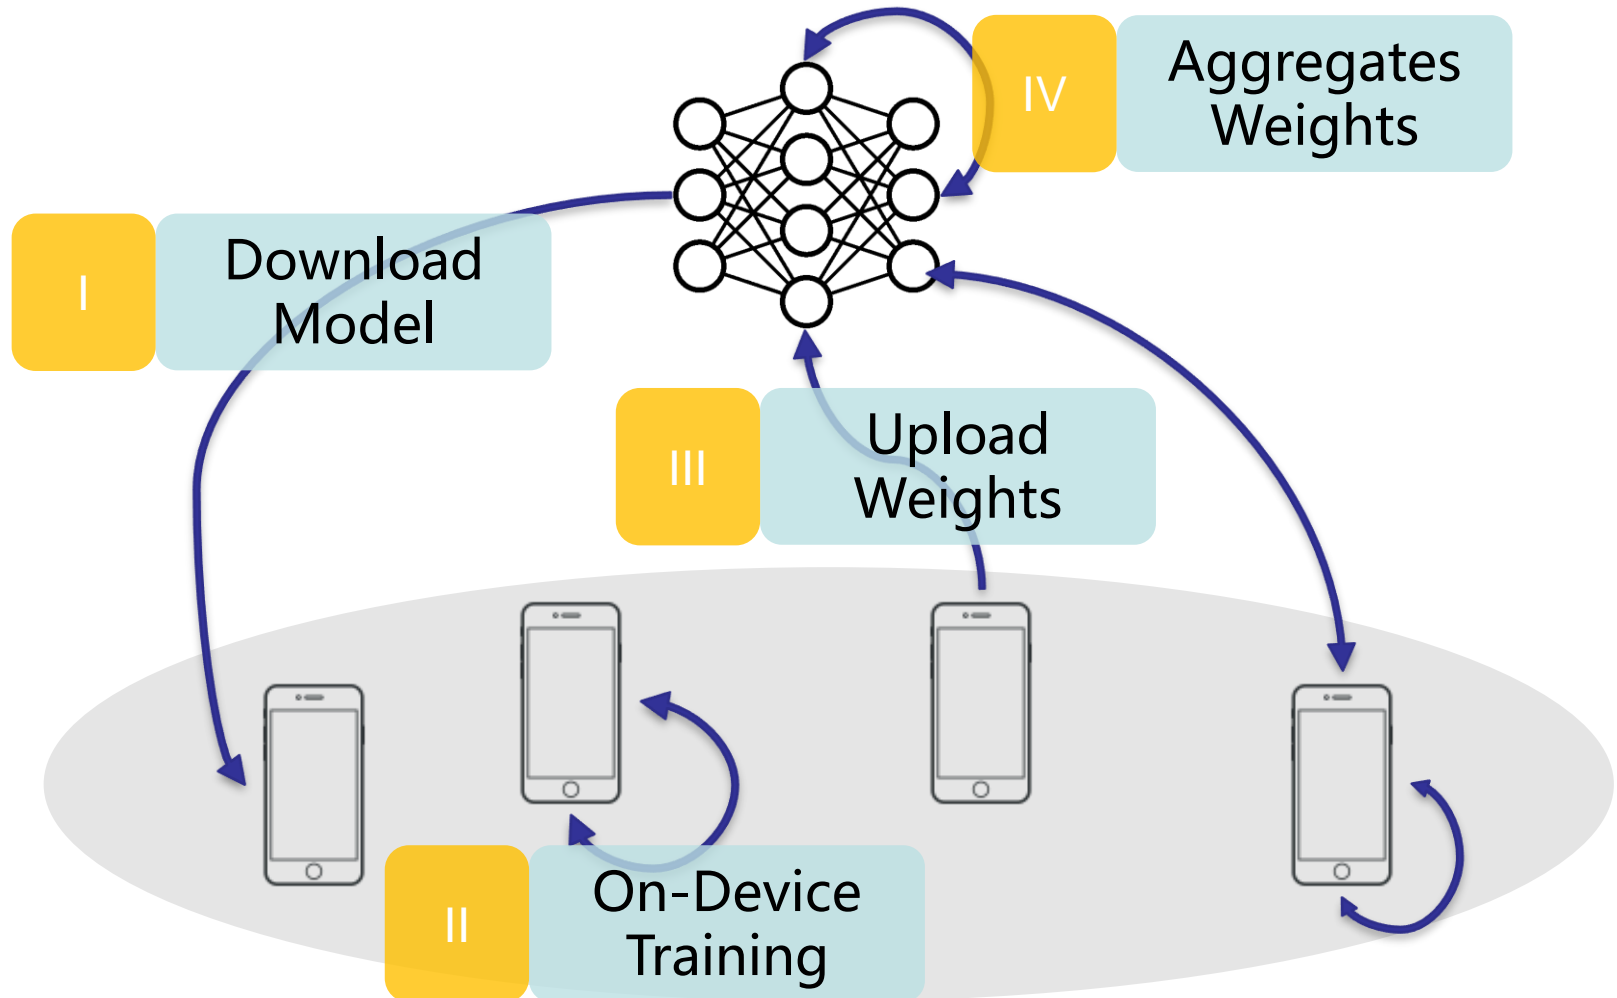

Atlanta, USA

July 14 - July 17, 2019

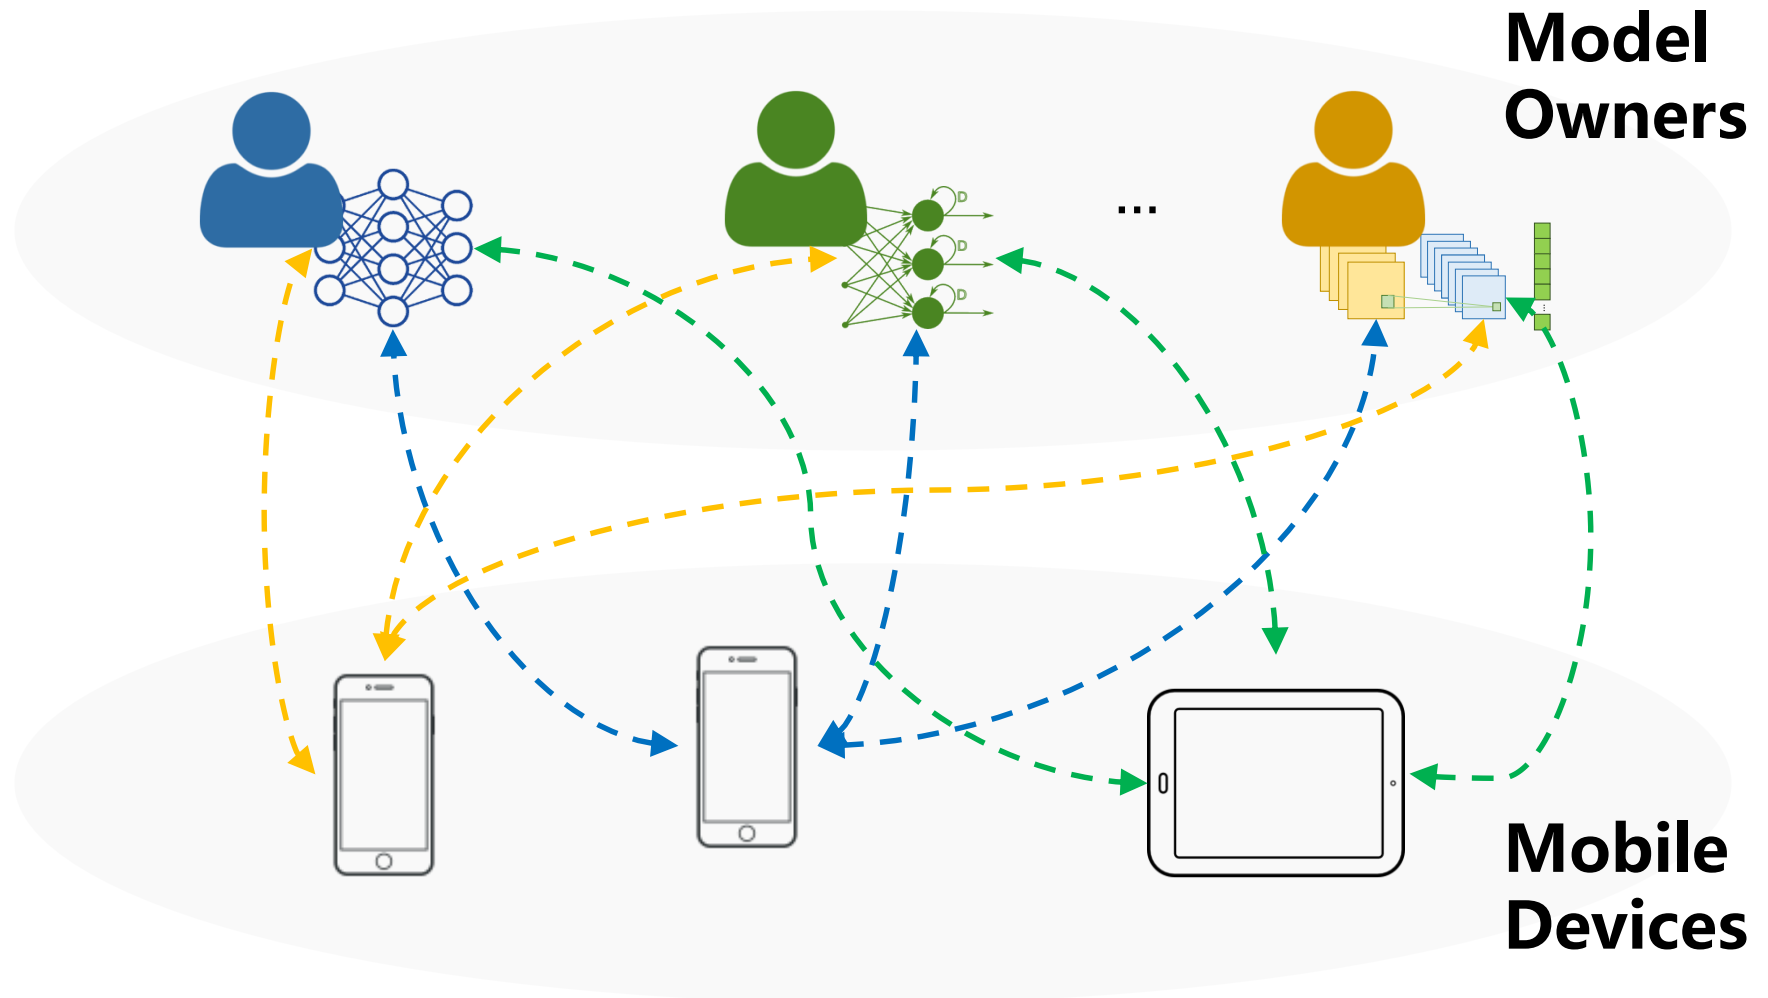

- **Introduction**
- **System Description**
- **Evolutionary Game Formulation**
- **Performance Evaluation**

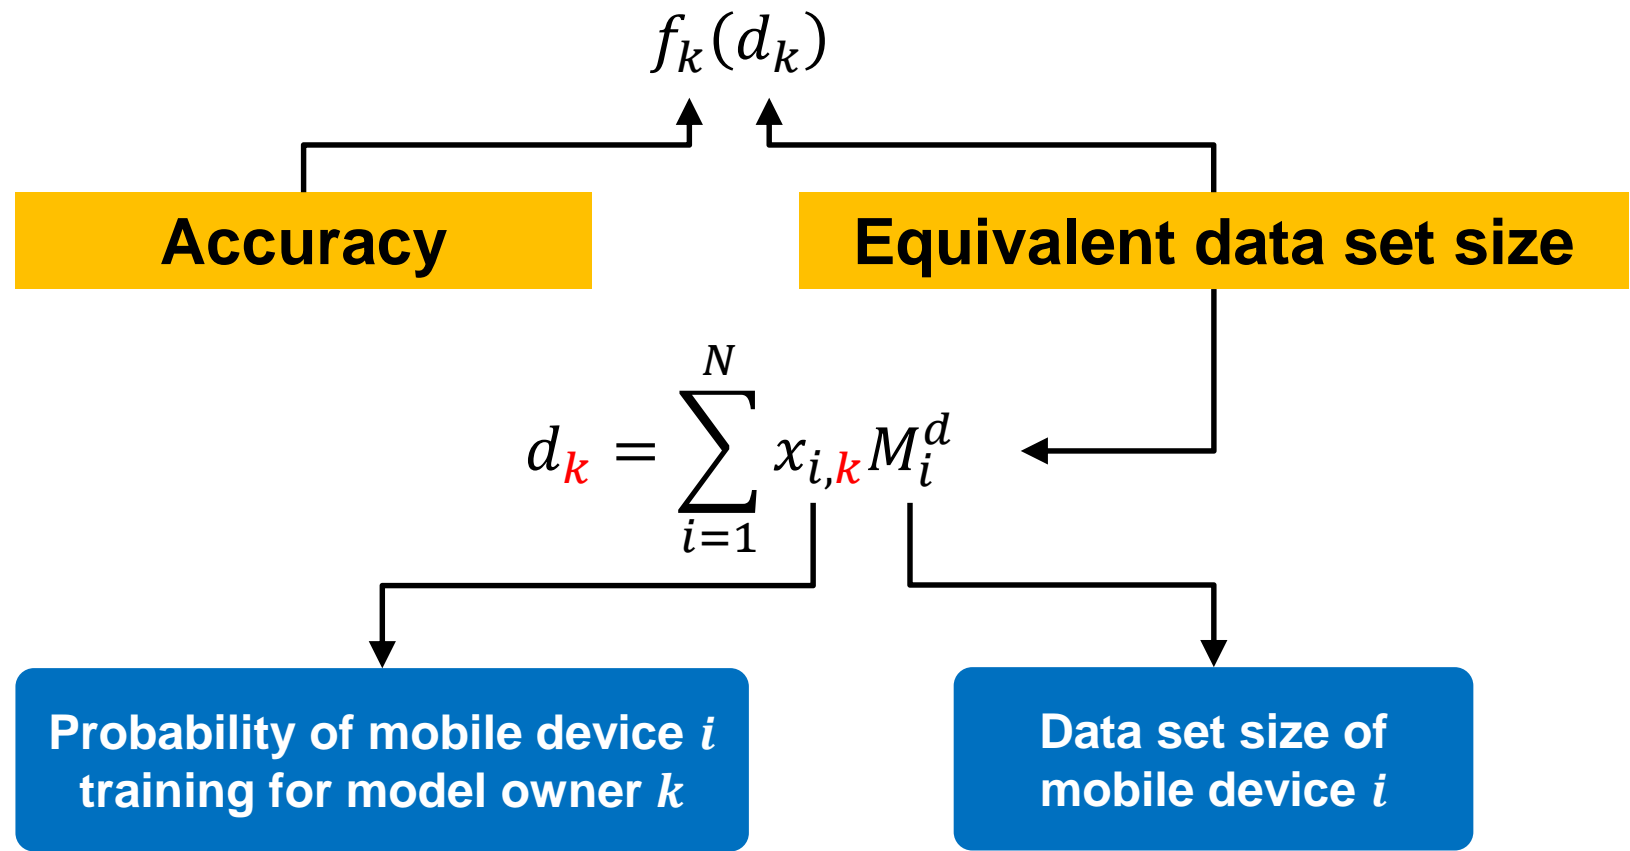

# System Description

GreenCom'19

- Accuracy of machine learning model

- Accuracy of machine learning model

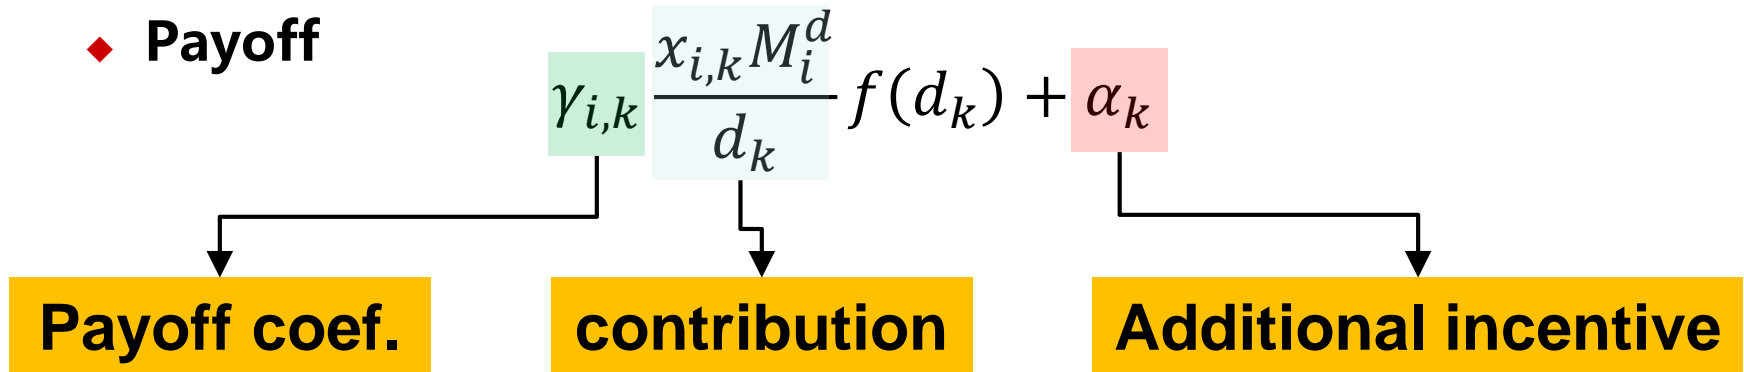

- Properties of  $f(d)$ 
  - ◆ Non-decreasing
  - ◆ Concave
  - ◆ Bounded

$$f_k(d_k)$$

- Utility of mobile device

- ◆ Payoff

- ◆ Cost

- ◆ Utility

$$u_{i,k} = \gamma_{i,k} \frac{x_{i,k} M_i^d}{d_k} f(d_k) + \alpha_k - \eta_{i,k} x_{i,k} M_i^d \quad (1)$$

## ■ Game Formulation

$$\mathcal{G} = (\mathcal{N}, \mathcal{A}, \mathcal{U})$$

where,

- SET of players ( $\mathcal{N}$ ): The set of mobile devices  $\mathcal{N}$  denotes the set of players of the game.
- SET of actions ( $\mathcal{A}$ ): The set of action for each mobile device is denoted as  $\mathcal{A} \triangleq \times_{k \in \mathcal{K}} [0, 1]$ .
- Utility function matrix: Let  $\mathcal{U} \triangleq [\mathbf{u}_1, \mathbf{u}_2, \dots, \mathbf{u}_N]$  denote the utility matrix for the federation of mobile devices.

## ■ Replicator dynamics

$$\dot{x}_{i,k}(t) = x_{i,k}(t) \left( u_{i,k}(t) - \bar{u}_i(t) \right) \quad (2)$$

Utility of mobile device  $i$  training for model owner  $k$

Mobile device  $i$ 's average utility

$$\bar{u}_i(t) = \sum_{k=1}^K x_{i,k}(t) u_{i,k}(t)$$

## ■ Equilibrium Analysis

- Definition: The evolutionary equilibrium is the solution of the game defined in (2), i.e., replicator dynamics.

- Uniqueness of the equilibrium

Proved via *Cauchy- Lipschitz theorem*.

- Stability of the equilibrium

Proved via *Lyapunov's second method*.

### PARAMETERS SETTINGS

	Value		Value
$N$	3	$K$	3
$M^d$	[100, 50000]	$\eta$	cf. Table II
$f(\cdot)$	cf. (6)	$\alpha_k$	[1 1 2]
$\mathbf{X}_0$	$\begin{bmatrix} 0.2 & 0.5 & 0.3 \\ 0.3 & 0.5 & 0.2 \\ 0.2 & 0.5 & 0.3 \end{bmatrix}$	$\gamma_{i,k}$	$\begin{bmatrix} 1 \\ 0.8 \\ 0.6 \end{bmatrix} \times \frac{[8,32,64]}{100}$

### FITTED MODEL COEFFICIENTS FOR ACCURACY AND ENERGY CONSUMPTION AGAINST TRAINING SET SIZE

$H$	Accuracy				Energy	
	$a$	$b$	$c$	$R^2$	$\eta$	$R^2$
0	20.74	0.8090	0.9228	0.9979	1.2303	0.9991
64	10.18	0.7017	0.9608	0.9902	2.9587	0.9987
512	2.26	0.4686	0.9875	0.9909	21.4793	1.0000

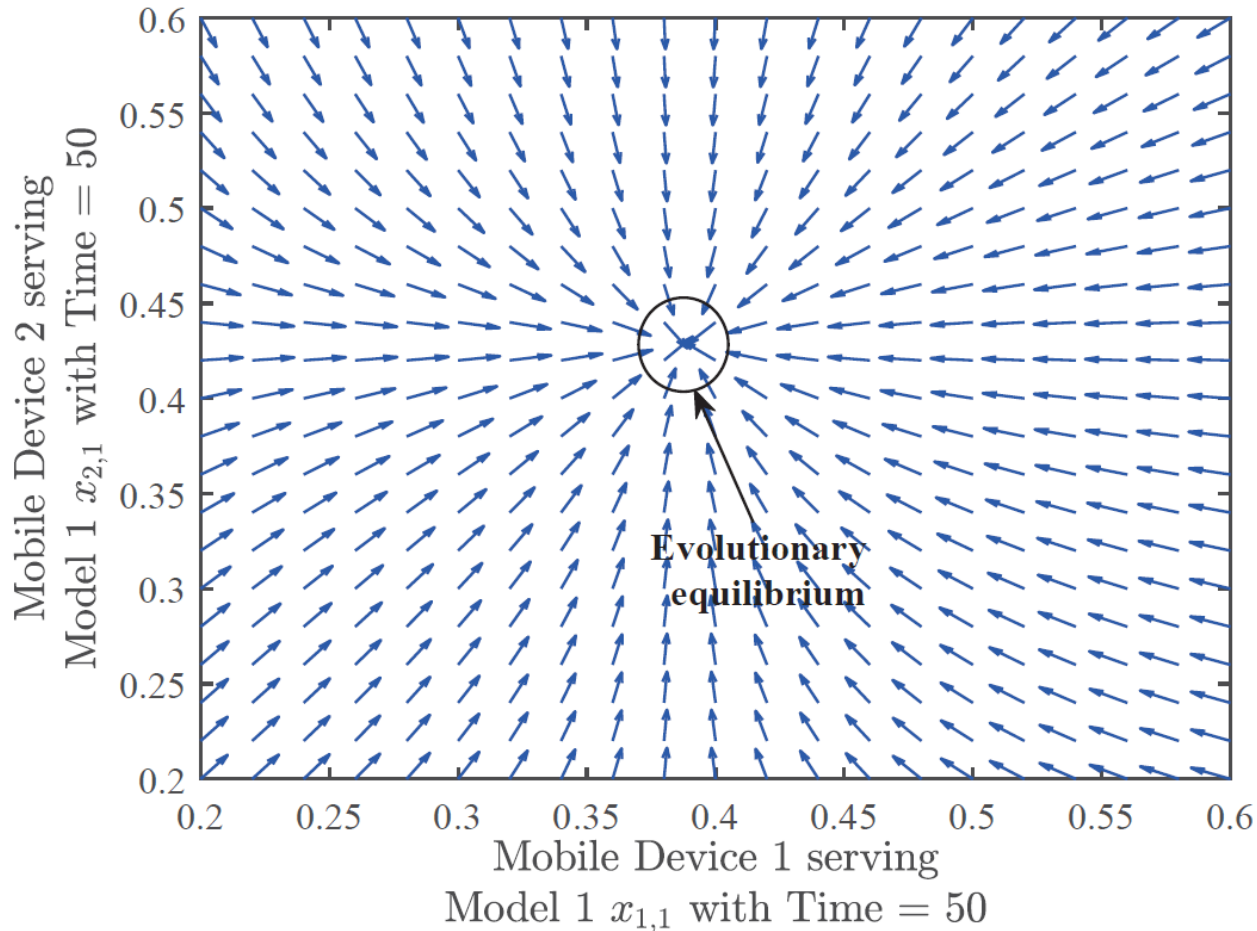

(a) Accuracy

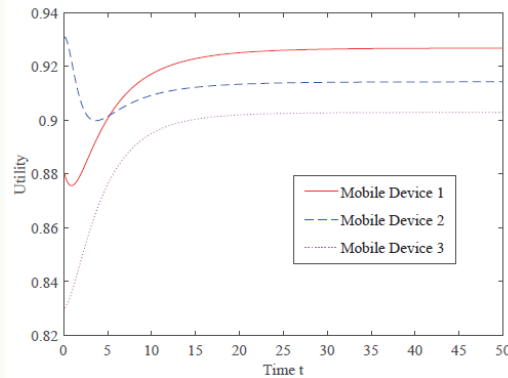

(b) Energy Consumption

**Accuracy and Energy Consumption Fitting for Different Learning Models**

**Direction Field of the replicator dynamics showing the stability of the evolutionary equilibrium**

(a) Utility

(b) Mobile device 1

(c) Mobile device 2

(d) Mobile device 3

**Evolutionary Game Dynamics: Utility and Training Strategy Variations of Mobile Devices**

## ■ **Contributions**

- ✓ We proposed two metrics, i.e., the accuracy and energy consumption of federated learning performance, which correspond to the benefit and cost, respectively.
- ✓ An evolutionary game model is formulated to investigate the mobile devices' training strategies under the scenario of multiple model owners. The uniqueness and stability of the evolutionary equilibrium are analyzed, and the stability is further validated numerically.

## ■ **Future work:**

- Take the non-iid property of federated learning into consideration

**Questions & Answers**

**Thank you !**
